

The Legacy Difference

When Legacy reinvented the tension fabric building, we changed the game for safety, engineering and client satisfaction.

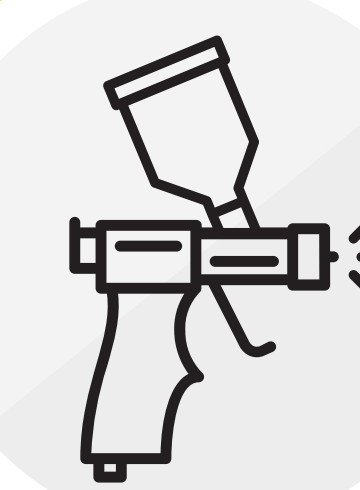

Rigid Frames

Legacy Building Solutions created the technology that allows fabric cladding to be secured to a rigid steel frame. Our patented attachment process is unique in the industry and provides a safer, more efficient way of installing.

Frame Finishes

EpoxiShield™ coatings come in a variety of different finishes, depending on the project application, and can provide better protection to your building frame, extending the life of your investment.

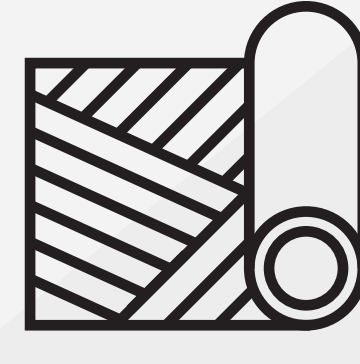

Technology

Legacy Building Solutions uses rigid frame building analysis software to custom-design each building for optimal use while meeting the appropriate geographical code requirements.

Exclusive Fabric

Our ExxoTec™ fabric is made from extremely strong and durable PVC. Our patented tensioning system works with the engineering properties of the fabric, so our buildings can stand up to harsh climates around the world.

Service

We employ the most experienced installation crews in the industry. Legacy's professional crews will properly tension the fabric to minimize maintenance and wear.

Rapid Installation

Fabric takes about a third of the time to install than other building cladding types, such as wood or metal. For an industry that has such a national impact and deadlines to meet, this is a major advantage.

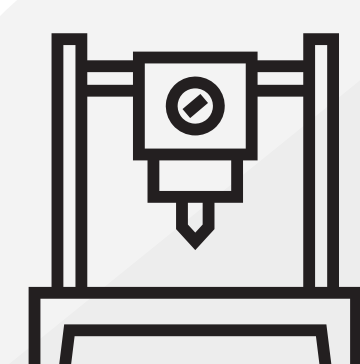

Quality

All building components, including the fabric and frames, are manufactured at our Minnesota facility. All of Legacy's processes are certified by ISO 9001:2015, and we maintain other certifications, including CWB, AWS, CSA A660, and Florida Product Approval.

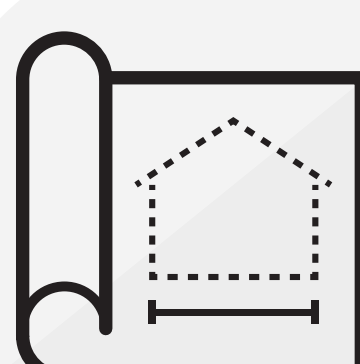

Sole Manufacturer

All building components are manufactured in our 87,000 sq ft facilities. As an end-to-end manufacturer, there is clear communication between the building owner through manufacturing all the way to building installation.

Clear Span Space

Due to Legacy's solid steel I-beam frames, and state-of-the-art software, floor space can be maximized. All of these are beneficial to keeping operations efficient and increasing ROI.

Customization

All of our buildings are custom designed and built. We'll work with you to make sure you have the exact size you need, as well as accessories to maximize your building usage.
